ADJUSTABLE FIT IN-LINE SKATE

I. BACKGROUND OF THE INVENTION

1. Field of the Invention

5 This invention pertains to skates such as in-line skates and the like. More particularly, this invention pertains to such a skate which may accommodate a variety of shoe sizes.

10 2. Description of the Prior Art

In recent years, the sport of in-line skating has enjoyed a tremendous growth in popularity. In addition to being enjoyable exercise for adults, children have participated in in-line skating.

15 High quality in-line skates can be expensive. The expense is particularly frustrating for parents of young children. As the children grow, their foot sizes expand necessitating frequent replacement of footwear of any type including recreational footwear such as in-line 20 skates.

In the past, in-line skate manufacturers have accommodated growth in foot size by having an oversized molded boot containing a replaceable liner. Liners of various wall thicknesses could be provided such that the 25 liners could be replaced to accommodate different foot sizes. Alternatively, various techniques have been provided for permitting the boot of the skate to adjust to accommodate growth in foot size. However, such techniques have commonly been lacking in providing for a construction 30 which is secure after adjustment and without impairing performance of the skate.

II. SUMMARY OF THE INVENTION

According to a preferred embodiment of the 35 present invention, an adjustable fit in-line skate is provided having a rigid frame with a plurality of in-line

skate wheels secured to the frame. A boot is secured to the frame with the boot having a toe portion and a heel portion. The heel portion includes a sole and the heel portion is fixed to the frame. The toe portion has a base 5 and is fastened to the heel portion by means which releasably secure each of the base and the sole to at least a portion of the frame. The toe portion is slidable relative to the heel portion along a line of travel which is generally parallel to the longitudinal dimension of the 10 skate. The toe portion may be fixed at any one of a plurality of fixed positions along the line of travel.

III. BRIEF DESCRIPTION OF THE DRAWINGS

Fig. 1 is a front, right and top perspective view 15 of the skate of the present invention;

Fig. 2 is an exploded perspective view of a liner for use with the skate of Fig. 1;

Fig. 3 is a right side elevation view of the 20 skate of Fig. 1 shown adjusted to a minimum foot size adjustment;

Fig. 4 is a left side elevation view of the skate of Fig. 1;

Fig. 5 is a front elevation view of the skate of Fig. 1;

Fig. 6 is a rear elevation view of the skate of 25 Fig. 1;

Fig. 7 is a top plan view of the skate of Fig. 1;

Fig. 8 is a bottom plan view of the skate of Fig. 1;

Fig. 9 is the view of Fig. 3 separately shown to 30 compare with Fig. 10;

Fig. 10 is the view of Fig. 9 with the skate adjusted to a maximum foot size adjustment;

Fig. 11 is an exploded perspective view of the 35 skate of Fig. 1 (without showing a liner);

Fig. 12 is a side sectional view of a toe portion of the skate of Fig. 1;

Fig. 13 is an enlarged view of a heel portion of the skate of Fig. 1 (with a cuff shown in phantom and without showing a frame); and

Fig. 14 is a view taken along line 14-14 of Fig. 13.

IV. DESCRIPTION OF THE PREFERRED EMBODIMENT

With reference now to the various drawing figures in which identical elements are numbered identically throughout, a description of the preferred embodiment of the present invention will now be provided.

In the various figures, an in-line skate 10 is illustrated having a skate boot 12 secured to a frame 14 and containing a liner 110. The frame 14 carries a plurality of wheels 16 which, in an in-line skate, are arranged in a line. Also, the frame carries a resilient brake pad 18 as is conventional.

Shown best in Fig. 11, the frame 14 includes two halves 14a, 14b. The frame halves 14a, 14b are slidably joined at offset and overlapping front tongues 20a, 20b (having holes 23) and rear tongues 22a, 22b (having holes 24). Holes 23 are in alignment when the halves 14a, 14b are joined. Holes 24 are similarly aligned when the halves 14a, 14b are joined. When the halves 14a, 14b are joined together, flat rear upper surfaces 26 of the halves 14a, 14b are in generally planar alignment to define a rear support platform. Upper surface 27 in the toe area of the frame defines a front support platform when the halves 14a, 14b are joined. As shown in Fig. 12, surfaces 27 are arcuate to mate with a base 76 to toe portion 34 as will be described.

Referring back to Fig. 11, the boot 12 includes a heel portion 30, cuff 32, toe portion 34 and tongue 36.

The heel portion 30 includes a sole 40 and a raised heel wall 42 having sidewalls 44, 46 each with holes 48, 50. The heel wall 42 surrounds the heel and lower ankle of the wearer with wall 46 being raised on the inside of the foot 5 to provide additional support 41 for the arch of the user.

The sole 40 includes a hole 52 formed in a recess 54 at a heel end of sole 40. Similarly, at a toe end of the sole 40, a hole 56 is provided between two ramped surfaces 58. The base or sole 40 is sized to rest on the 10 rear support platform 26 and the front support platform 28 with hole 52 aligned with holes 24 and with hole 56 aligned with holes 23. A bolt 60 is sized to be passed through hole 52 with the head end of the bolt received within the recess 54 and with the bolt 60 further passing through 15 holes 24 and secured by a nut 62. Similarly, a bolt 64 having a head 66 sized to be received between ramped surfaces 58 is provided with the bolt 64 passing through hole 56 and aligned holes 23 and received within an elongated nut 68. As can be seen, since holes 52, 56 are 20 approximately equal to the diameter of bolts 60, 64, once the heel portion 30 is secured to the frame 14, the heel portion 30 is restricted from movement relative to the frame 14.

The toe portion 34 includes a toe box having 25 sidewalls 70, 72 and a top wall 74. Further, as shown in Fig. 12, toe portion 34 has a bottom wall 76. The bottom wall 76 is provided with an elongated slot 78 extending in a longitudinal dimension of the skate to pass the bolt 64. When assembled with the heel portion 30, the toe portion 34 30 is provided with the base 76 in underlying relation relative to the sole 40 of the heel portion 30. Further, the sidewalls 70, 72 are positioned in overlying relation to the exterior surfaces of the sidewalls 44, 46 of the heel portion 30. The sidewalls 70, 72 are provided with 35 elongated slots 75, 77 aligned with holes 48, 50,

respectively. With the construction thus described, upon loosening of elongated nut 68 (by use of an Allen wrench received in hole 69 -- see Fig. 12), the toe portion 34 may move along a line of travel which is generally parallel to 5 the longitudinal dimension of the skate. The slots 75, 77 are aligned such that throughout the path of travel, the slots 75, 77 remain aligned with holes 48, 50.

The cuff 32 is provided to surround an upper ankle area of the wearer and surrounding the heel portion 10 42 as well as the rearward ends of the sidewall 70, 72. The cuff 32 has at its lower end pivot locations 80, 82 having holes 84, 86 aligned with holes 48, 50. A recessed area 88 surrounds hole 84. Although not shown, an identical recessed area surrounds hole 86.

15 The attachment of the ends 80, 82 at holes 48, 50 is identical for both sides of the skate and a description with respect to end 80 will suffice as a description of end 82. The attachment is best shown in Figs. 13 and 14 where a plug 90 (shown partially in phantom) is provided sized to 20 be received within the recess 88 and with a sleeve 91 having an internal thread passed through hole 84, slot 76 and hole 48. A threaded bolt 92 is threaded into the interior of the sleeve 91. This method of attachment permits pivoting movement of the cuff 32 relative to the 25 heel 30 and toe 34. Further, the connection permits relative sliding movement of the toe 34 relative to the heel portion 30 upon the loosening of nut 68.

A conventional buckle arrangement having a release fastener 96 secured to one side of cuff 32 and a 30 tensioning buckle and strap 98 secured to the opposite side of cuff 32 is provided to permit the cuff 32 to be securely fastened to the leg of a wearer. Similarly, a like buckle arrangement having a tension strap and buckle 97 and a release fastener 102 are provided on opposite sides 70, 72 35 of the toe portion 34 to securely fasten the instep of the

wearer's foot to the boot 12. Finally, a tongue 36 is provided as is conventional.

With the construction thus described, a wide variety of foot sizes can be accommodated by simply 5 loosening nut 68 such that the toe portion 34 is moved relative to the heel portion 30. About four different foot sizes can be achieved by permitting a stroke of movement equal to about one inch. Accordingly, the slots 76, 78 will have a length of about one inch. Since a sliding 10 adjustment is provided, unique adjustment is possible to accommodate unique foot sizes within a range between a minimum foot size (Fig. 9) and a maximum foot size (Fig. 10). Further, the foregoing design permits the use 15 of a pivoting cuff 32 which has numerous advantages in the performance of in-line skating. Also, throughout the adjustment of the length, the positioning of the user's heel relative to the frame 14 and wheels 16 remains unchanged which presents a significant advantage in the 20 performance of in-line skating since heel positioning is important to the performance of the skate.

The present invention also utilizes a novel construction of a liner 110 (Fig. 2) to accommodate increases in shoe size. The use of resilient liners in in-line skates is well known. The present liner 110 includes 25 a toe portion 112 joined to the main body portion 114 by an expandable resilient section 116 positioned surrounding the instep area of the foot. Accordingly, the toe portion 112 may move relative to the main body portion 114. A lug 117 is provided on the toe portion 112. The lug 117 is secured 30 to the upper wall 74 of the boot toe 34 by passing the lug 117 through a hole 118 formed in the upper surface 74 and securing the lug 117 in said position by a bolt or screw 120 (Fig. 12). The area surrounding the hole 118 is provided with a recess 121 to receive a decorative cap 122. 35 Accordingly, as a user adjusts the size of the boot by

expanding the toe portion 34 of the boot, the toe 112 of the skate liner 110 follows the toe 34 of the boot 12.

From the foregoing detailed description of the present invention, it has been shown how the objects of the 5 invention have been attained in the preferred manner. However, modifications and equivalents of the disclosed concepts such as those which readily occur to one skilled in the art are intended to be included within the scope of the claims which are appended hereto.
